Where are my raw access logs stored?

The path to the raw access logs for your domain on our servers is as follows where "domain.com" represents your actual domain name:

```
/usr/local/apache/domlogs/domain.com
```

Separate access logs are maintained in the same domlogs directory for each subdomain you may have on your account.

```
/usr/local/apache/domlogs/subdomain.domain.com
```

Changing your default index page to something else (.htaccess modification)

When you open up your website, it's your "index.html" that loads right? Ever thought it would be nice if somebody went to yoursite.com that they'd go to

IP banning through .htaccess

From the .htaccess file, you can ban certain IP addresses from getting access to your site at all. You'll need to add the following into your .htaccess file:

```
<B>CODE</B>
```

```
order allow,deny  
deny from xxx.xx.x.x  
allow from all
```

All the work you need to do is replace the "xxx.xx.x.x" with the IP you want to ban. You can also do more than once, just add the "deny from xxx.xx.x.x" under the previous one, like this:

```
<B>CODE</B>
```

```
order allow,deny  
deny from xxx.xx.x.x  
deny from xxx.xx.x.x  
deny from xxx.xx.x.x  
allow from all
```

This shows you that three IP addresses are being blocked. You could also change

Make .php code read as .html, easy .htaccess change!

Say you want to use a PHP include inside one of your pages, but they all have a .html extension. If you don't want to convert your page to a .php extension, just add this one simple line of code to your .htaccess file.

```
<B>CODE</B>
```

```
AddType application/x-httpd-php .php .html
```

This will treat all the code in your pages as PHP before it displays it on the page.

I'm getting an error when I try to manage my mailing list

The Cpanel Mailing list will not work until your domain name is live.
